

## WHAT IS CLAIMED IS:

1. A method of detecting and locating noise sources each emitting a respective signal  $S_j$  with  $j = 1$  to  $M$ , detection being provided by means of acoustic wave or vibration  
 5 sensors each delivering a respective time-varying electrical signal  $s_i$  with  $i$  lying in the range 1 to  $N$ , the method consisting:

- in taking the time-varying electrical signals delivered by the sensors, each signal  $s_i(t)$  delivered by a  
 10 sensor being the sum of the signals  $S_j$  emitted by the noise sources;
- in amplifying and filtering the time-varying electrical signals as taken;
- in digitizing the electrical signals;
- 15 · in calculating the functional  $f$ , such that:

$$f(\mathbf{n}_1, \dots, \mathbf{n}_j, \dots, \mathbf{n}_M) = \frac{\det(\langle \mathbf{T}_k(\omega), \mathbf{T}_1^*(\omega) \rangle \quad k, l = 0 \text{ to } M)}{\det(\langle \mathbf{T}_k(\omega), \mathbf{T}_1^*(\omega) \rangle \quad k, l = 1 \text{ to } M)}$$

with

$$(\mathbf{T}_k(\omega))_i = e^{\frac{j\omega \langle \mathbf{n}_k, \mathbf{c}_i \rangle}{c}}$$

- 20         $\langle \dots \rangle$  being the scalar product;
- ..  $\mathbf{c}_i$  being the vector constructed between the center of gravity of the sensors and the position of sensor  $i$ ;
- ..  $\mathbf{n}_j$  being the unit vector in the direction defined by the center of gravity of the sensors and source  
 25         $j$ ;
- .. with  $\mathbf{T}_0 = \mathbf{s}$ ; and
- .. with  $c$  = the speed of sound; and
- in minimizing the functional  $f$  relative to the vectors  $\mathbf{n}_j$  for  $j = 1$  to  $M$  in such a manner as to determine  
 30        the directions  $\mathbf{n}_j$  of the noise sources.

2. A method according to claim 1, wherein, in order to minimize the functional  $f$  when the noise sources are narrow band sources, the method consists:

- in calculating the Fourier transforms of the signals  $s_i(t)$  delivered by the sensors;
- in using the expressions for the determinants of the matrices of general term:

5

$$\langle T_k(\omega), T_l^*(\omega) \rangle$$

to calculate the functional:

$$f_1 = \sum_k \|B(\omega)_k\|^2$$

- and after selecting a determined number of noise sources, in minimizing the functional  $f_1$  to determine the directions  $n_j$  of the selected noise sources.

3. A detection method according to claim 1, wherein, in order to minimize the functional  $f$  when the noise sources are broad band, the method consists:

15

- in calculating the Fourier transforms of the signals  $s_i(t)$  delivered by the sensors;
- in using the expressions of the determinants of the matrices of general term:

$$\langle T_k(\omega), T_l^*(\omega) \rangle$$

20

to calculate the functional:

$$f_2 = \int \|B(\omega)\|^2 d\omega$$

- and after selecting a determined number of noise sources, in minimizing the functional  $f_2$  to determine the directions  $n_j$  of the selected noise sources.

25

4. A detection method according to claim 1, wherein, in order to minimize the functional  $f$ , the method consists:

- in simplify the expression for the functional  $f$  to minimize the following functional  $f_3$ :

30

$$f_3 = \int \det(\langle T_k, T_l^* \rangle) k, l = 0 \text{ to } M d\omega$$

- in calculating the cross-correlation functions  $\gamma_{ij}$  of the signals  $s_i$  and  $s_j$ ; and
- after selecting a determined number of noise sources, in minimizing the functional  $f_3$ .

5. A detection method according to claim 1, wherein,  
after the minimization operation, the method consists in  
calculating the source vector:

5                    $s(\omega) = ({}^t T^* \cdot T)^{-1} \cdot {}^t T^* \cdot s(\omega)$   
in order to discover the characteristics of the noise  
sources.
